- | | |
|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1. A process in which cells use oxygen to release energy stored in sugars. | 9. Multicellular only. Genetic material in nucleus. Surrounded by its own membrane. |
| 2. Unicellular organism; moves using its flagella; asexual reproduction; have chloroplasts to absorb sunlight. | 10. Unicellular only. No nucleus or organelles with DNA. |
| 3. A structure in a cell enclosed by membrane that performs a specific function. | 11. The structures in the body that work together to transform the energy and materials in food into forms the body can use. |
| 4. Contains genetic material a cell needs to reproduce and function; directs all activities. | 12. Wavelike contractions of smooth muscles in the organs of the digestive tract; the contractions move food through the digestive system. |
| 5. A group of organs that filter waste from an organism's blood and excrete it in a liquid called urine. | 13. A system that interacts with the environment and with other body systems to bring oxygen to the body and remove carbon dioxide. |
| 6. Mostly unicellular organisms that have a nucleus (prokaryotic) and do not belong to animal, plant or fungi kingdoms. | 14. A system of organs within an organism which work together for the purpose of reproduction. |
| 7. Storage bubbles in cells within cytoplasm. | 15. Produces most of the cell's energy; cellular respiration occurs here."Powerhouse of the Cell." |
| 8. Plant cell organelle containing chlorophyll that captures sunlight and turns it into food (photosynthesis). | |

prokaryote
excretory system
peristalsis
respiratory system

vacuole
euglena
chloroplasts
digestive system

reproductive system
cellular respiration
protista
nucleus

organelle
mitochondria
eukaryote
