- 1. Part of the process of sexual reproduction in which a male reproductive cell and a female reproductive cell combine to form a new cell that can develop into a new organism.
- 2. A type of reproduction in which male and female reproductive cells combine to form offspring with genetic material from both cells.
- 3. Made up of one or many cells and is capable of growing and reproducing.
- 4. Shows family relationships including two or more generations.
- 5. A part of sexual reproduction in which cells divide to form sperm cells in a male and egg cells in a female. Only occurs in reproductive cells.
- 6. The genetic transmission of characteristics from parent to offspring.
- The process by which a single organism produces offspring that have the same genetic material; makes a copy of itself.

- The phase in the cell cycle during which the nucleus divides.
  Formation of an automuth from an argonian
- 9. Formation of an outgrowth from an organism that is capable of developing into a new individual.
- 10. The observable characteristics or traits of an organism.
- 11. An allele that is not expressed when combined with a dominant form of the gene.
- 12. The new organisms produced by one or two parent organisms.
- 13. Any change made to DNA.
- 14. A chart used to show all the ways genes from two parents can combine and be passed to offspring.
- 15. A disease or disorder that is inherited genetically.

| punnett square   | genetic disease     |
|------------------|---------------------|
| inherited trait  | fertilization       |
| recessive allele | sexual reproduction |
| pedigree chart   | mitosis             |

| mutation             | phenotype |
|----------------------|-----------|
| meiosis              | organism  |
| asexual reproduction | offspring |
| budding              |           |
