- Made up of one or many cells and is capable of growing and reproducing.
- A part of sexual reproduction in which cells divide to form sperm cells in a male and egg cells in a female. Only occurs in reproductive cells.
- Part of the process of sexual reproduction in which a male reproductive cell and a female reproductive cell combine to form a new cell that can develop into a new organism.
- Shows family relationships including two or more generations.
- Any change made to DNA.
- The new organisms produced by one or two parent organisms.
- The genetic transmission of characteristics from parent to offspring.
- Formation of an outgrowth from an organism that is capable of developing into a new individual.
- An allele that is not expressed when combined with a dominant form of the gene.
- The process by which a single organism produces offspring that have the same genetic material; makes a copy of itself.
- A disease or disorder that is inherited genetically.
- The phase in the cell cycle during which the nucleus divides.
- A type of reproduction in which male and female reproductive cells combine to form offspring with genetic material from both cells.
- A chart used to show all the ways genes from two parents can combine and be passed to offspring.
- The observable characteristics or traits of an organism.
